

10 kw water turbine

10 kw water turbine

Suneco Hydro is a 10kw Hydro Turbine generator manufacturer in China and 86% of our 10kw Hydro Turbine are exported to Europe, the US, Canada, Japan, Indonesia, Malaysia, the Philippines, Australia, Romania, South Africa, and Thailand. We provide customization service of all our mini, small, large hydro turbines. OEM samples of 10kw Hydro Turbine can be delivered in 15-25 working days. Other water turbines, Pelton turbines, small hydro turbines, mini-hydro turbines are all in our business scope.

All our Staff works with 20 years experience.

This article gives a summary of the basics of a 10kw hydro turbine electricity generator. This can be for home, small business, farm, and even a small production factory.

The 10kw hydro turbine electric generator is usually installed at small rivers or streams that have a reliable flow of water throughout the year. It converts the water flow energy into mechanical energy and then into electricity.

A 10kw hydroelectric generator works like a waterwheel, rotating a shaft attached to electrical generators (motors). These devices use the hydroelectric potential of a watercourse to generate electric currents. The design ensures that

As the name suggests, this hydro generator is capable of generating 10,000 watts of electricity. This energy is enough for running various electric devices. You can use it for small-scale generation of power. It is an ideal solution for both domestic and small commercial needs.

The generator has a hydroelectric capacity of 10 kilowatts. The maximum pressure it can handle is 4.5 meters per second. The available fluid height range is between 0.3 and 5 meters.

The diameter of the hydro turbine's penstock pipe is 50 millimeters, while its discharge pipe opening size measures 35 millimeters in diameter.

This hydroelectric system's efficiency is set at 80%. It provides hydroelectric power rated in voltage while at the same time guaranteeing an adequate supply of currents in amperes.

The hydro turbine can generate hydroelectric power anywhere, whether it be in tropical locations or even in temperatures as low as -30 degrees Celsius.

The hydro turbine system includes a hydro turbine, hydro generator, and hydro circuit. The hydropower system comprises three main parts: the hydro-generator, hydro unit, and hydro controller for operation.

10 kw water turbine

In a hydro system, each part has to work together to make the hydropower plant successful and efficient.
