10kw solar system price australia

Up to 4 Solar Installers Compete For Your Business

As the cost of solar panels significantly decreases in Australian markets, an increasing number of owners of extensive properties are showing keen interest in installing a 10kW solar power system.

A 10kWh solar panel system costs \$10,239 on average Australia-wide. However, the prices can go as high as \$10,789 and as low as \$9,571 depending on the government rebate, installer and quality of panels/ inverted used.

On average, most Australians pay \$10,239 to install a 10kw solar system. However, the prices can go as high as \$10,789 and as low as \$9,571 after the government rebate.

Ideally, a good quality 10kw solar power system will generate 40 - 55kWh daily. However, the 10kw system output is subject to the solar system's location, the panel's array tilt angle, and orientation.

Temperatures and shading may also affect the system's efficiency.

The 10kw system output also varies depending on the season of the year. Your 10kw solar power system is more likely to generate more electricity during summer than winter.

Below is a table of the average daily production of a 10kWh by major cities.

A quality 10kw solar system requires about 27-34 solar panels. The precise number of panels you'll need depends on the wattage of each panel.

If the panels have a 350-watt rating, 29 panels will be enough for your system. However, with about a 300-watt rating or lower, the number of panels needed will also increase.

To put this into perspective:

27 - 34 solar panels mean that you need a lot of roof space. Since most solar panels measure 1.6m x 1m, you'll need at least 54 - 80 square meters in space, depending on panel wattage.
