

## Accra microgrid benefits

There are several benefits to using microgrids, including: [1] Increased Reliability: Microgrids can provide a more reliable source of energy, as they can continue to operate even if the traditional power grid goes down.

approach to achieve universal electrification [6]. Renewable energy minigrids therefore hold enormous prospects for the African energy sector, not only by enhancing energy access, but also by enabling the increased use of low-carbon energy sources, with the benefits for sustainable rural development.

Microgrids serve industries, institutions, communities and other customers in a range of ways. Here we look at eight main microgrid benefits - from keeping the lights in a storm to lowering energy costs to improving community well-being. Eight microgrid benefits. 1. A microgrid improves electric reliability.

These innovations, being tested by mini-grid developers in the field, include using smart inverters to modularly increase grid capacity, bulk procuring components to reduce installation costs, reducing tariffs to spur consumption, and offering appliance financing for grain mills and other productive use appliances to enable customers to ...

Whether they're called microgrids or minigrids (another term for remote microgrids that are not connected to a centralized grid), the electricity delivered by the technology has been proven to drive economic development and reduce poverty as well as improve access to clean water and the internet.

With many thanks to colleagues across the DFID network and partners for their inputs and checking of the detail on the programmes below, and none of the blame for any misinterpretations or mistakes I have introduced.

In March this year the Green Mini-Grids (GMGs) Africa Regional Facility programme officially closed, marking 5 years of DFID support to the development of the sector in Africa. That support is continuing seamlessly, into a second phase, now as part of the wider Africa Clean Energy (ACE) programme. But the transition point remains significant, including for me personally as someone who has been involved since the outset.

If the launch of the programme in 2014 was part of the process of "forming" the mini-grids sector, then I think it's fair to say the last 5 years has also seen its share of "storming" as a range of approaches have been tried to bringing together the key elements of industrial capabilities, government policy and private finance. With larger country programmes now in place, with increasingly supportive policies drawing on better-evidenced playbooks, and cross-sectoral second generation initiatives like the Universal Energy Facility in development - I think we are now in the necessary "norming" phase, before the "performing" needed to meet the 2030 SDG7 target.

The original GMGs Africa business case had the following stated objectives:

This programme aims to help transform the Green Mini-Grids sector in Africa from a nascent and sporadic series of pilot projects, to a thriving industry on track to contribute the IEA's estimated 40% of universal electricity access by 2030. This will be achieved by creating a critical mass of experience and evidence of GMGs success in two countries, coupled with improved policy and market conditions for investment in mini-grids regionally.

In the 5 years since the programme started so many things have changed, new partnerships have emerged, new governments have seen the potential of mini-grids, new funding partners have come in to the market, and much more. That makes it difficult really to even assess the programme as originally conceived against how things have gone, but I will have a go, taking each of the key outcomes we hoped could be achieved in turn.

And please &#8211; comments, corrections, and different perspectives very welcome. Go ahead and comment below, I will answer if I can, or try to find the answer from other colleagues if not.
