

Commercial solar rooftop cost

Commercial solar rooftop cost

Commercial solar panels cost \$2.50 to \$3.50 per watt installed before incentives. With tax credits and other incentives, solar panels for commercial buildings cost \$1.20 to \$1.75 per watt, depending on the location, size, and complexity. Saving up to 75% on electricity helps offset the commercial solar installation costs.

The commercial solar sector includes most non-residential properties, including office buildings, retail businesses, factories, warehouses, schools, hospitals, clinics, government organizations, non-profits, religious organizations, agricultural businesses, and parking garages and lots.

The table below details a typical cost breakdown for a commercial solar system installation. Keep in mind these are averages and the specific costs for each business vary depending on many factors.

Balance of system (All other components making up the solar array—mounting structures, inverter, cables, wiring, electrical panel, etc.)

Several factors influence the cost of a commercial solar panel system including:

Electricity usage - The more energy you consume the bigger the more solar panels you'll need to offset the costs.

Off-grid vs. grid-tied - For total energy independence, you'll need to factor in the extra costs for battery storage and generators. A 30kW off-grid solar system costs \$120,000 to \$150,000 to power a small business. Check local laws before investing, as some areas may require maintaining connection to the grid.

Location & market - The number of sunny days impacts the size and number of panels needed. Location also affects labor rates, regulations, requirements, permitting fees, interconnection fees, and available incentives.

Interconnection point - The distance from the solar panel system to the point of interconnection affects the cost. The farther away the system is, the higher the installation cost.

Solar panel type - Monocrystalline is more expensive but is the most efficient option, best for businesses working with limited space. Polycrystalline is cheaper but less efficient. Thin-film is cheapest but needs the most space. Most commercial panels are large--72-cell or 96-cell panels--and use larger inverters.

Assembly - Pre-assembled solar energy systems typically cost less than buying all the components separately.

Brand & quality - Higher quality components from well-established brands cost more but tend to last longer and often come with longer warranties.
