“AI” was undeniably the name of the game at this year’s Consumer Electronic’s Show in Las Vegas. While it’s been two years in the making, we’ve officially reached a generative nexus point, conceding to admit that ChatGPT has reshaped an entire industry — the automated future is now. Pretty much everyone from Big Tech giants like Google and Microsoft, to itty-bitty startups with big Kickstarter dreams hailed their usage of generative AI at this year’s show — whether or not it deserved to fit into the products themselves, however, is another matter entirely.

Yes, it feels like nearly every new announcement was boasting a “smarter” future with the help of artificial intelligence, from AI binoculars for the savvy birder, to an adjustable electric toothbrush that feels like putting an entire computer in your mouth. It was overwhelming at times, given 2023’s show focused mostly on minor improvements to existing flagship products as opposed to bold new swing-for-the-fences technologies.

Still, we were still surprised and delighted by some key product innovations, AI-infused and otherwise. So we dug through the digital noise, watched press conferences, and even live-streamed product demos, and found 32 gadgets deserving of our Rolling Stone “Best Of CES 2024” Award.

We chose our CES 2024 award winners based on design, functionality and innovation, focusing on unique products that help solve everyday problems, upgrade our life, or push the limits of technology. Scroll through to see the companies and products that made our Best of CES 2024 list.

After a ho-hum year of TV releases from usual titans of the small screen Samsung and Sony, the buzziest model at CES year by far proves that, sure, you can always go bigger and brighter — but transparency has never looked cooler.

LG’s new Signature OLED T isn’t reinventing the wheel — transparent OLED technology has been around for years commercially. But for the first time in 2024, LG is making the

see-through TV a must-have part of your home entertainment setup. We actually saw their transparent OLED concept in-person at last year's show, and while it's not clear-as-glass, this living room-ready model combines the best parts of their M4 series with "cool factor" of being able to turn your TV into an eye-catching piece of home decor (the transparent fish tank demo we saw was certainly better than anything the Samsung Frame can do).

Speaking of the M4 series, the OLED T smartly supports LG's "Zero Connect" wireless connectivity: an external box housing all the HDMI connections and media players you need with the ability to beam 4K 120Hz video straight to the screen from up to 30 feet away. Overall, LG's OLED T is firing on all cylinders when it comes to attention to design detail, and that's the transparent truth. Releases: Late 2024.
