

Electric vehicle incentives people s republic of china

China has emerged as a global leader in electric vehicle (EV) sales due to the government's industrial incentive policies. However, as industrial and incentive policies undergo adjustments and the market scales up, the efficacy of mixed incentive policies in a mature market becomes increasingly relevant compared to individual policies.

This paper focuses on the development of the EV industry in China and empirically examines the impact of the government's incentives on EV adoption in both the public and private domains using data from 61 cities spanning 2009-2018.

Battery electric vehicles will get 60 % discount and on the other hand hybrid electric vehicles will receive 35-50 % discount [49, 166]. The policies of electric vehicles in China are categorized by substantial government subsidies, stringent manufacturing quotas, and extensive infrastructure investment.

To promote the development and diffusion of electric vehicles, central and local governments in many countries have adopted various incentive programs. This study examines the policy and market drivers behind the rapid development of the electric vehicle market in China, by far the largest one in the world.
