ENERGY STAR is a widely recognised and trusted label on products that meet strict energy-efficiency requirements set by the U.S. Environmental Protection Agency (EPA). ENERGY STAR certified products are third-party certified and subject to ongoing verification testing. These appliances help consumers save money on operating costs, by reducing energy use without sacrificing performance, as well as protect the environment.

Home appliances, including refrigerators, hot water heaters, dishwashers and clothes dryers consume a lot of energy. Consider purchasing appliances with the Energy Star rating (see below) if you're in the market for new appliances or are looking to upgrade.

Automated control systems for air conditioning units, lighting and other systems that access data, such as outside air and room temperature, humidity, light level and occupancy, will boost home energy efficiency. New electronic devices and appliances can now be linked to the internet to provide real-time data that makes it easier to understand and lower energy use.

Some systems control smart appliances, for instance turning on an oven so it's already pre-heated when you get home; turning off a coffee maker you accidentally left on; or closing a garage door or gate at your command.

Whether you're roasting a chicken or saut?ing veggies, chances are, your kitchen appliances get a daily workout. No matter what's cooking, ovens and stoves consume a lot of energy.

Some cooking tricks to conserve energy:

Energy efficient windows. Energy-efficient windows can decrease your air conditioning costs. Switching from single-pane to double-pane windows requires an initial investment, but the cost savings will add up as you spend less on energy bills. Installing window tint can also help. Tint film reflects solar energy to improve comfort year-round and provides impressive energy savings. By keeping windows shaded on hot days, you can cut down on air conditioning usage.

Setting your thermostat to a lower temperature will not cool your home faster.

New Tech. Consider investing in an inverter air conditioning unit. While it is more expensive than

conventional units, it can be 30%-50% more efficient than conventional A/Cs.

Kilowatt hours (kWh) is a way to measure the amount of electricity consumed. It is commonly used as a unit for billing electricity delivered by electric utilities.
