

Enphase ensemble system

Enphase ensemble system

Enphase Energy has a vision of a completely solar-powered planet, and they are working to realize this vision with their solar energy products. Their three guiding commitments are innovation, quality, and responsibility, which certainly show through in their Ensemble line.

Unlike other hybrid battery backup systems that are always reliant on the local power grid, the Ensemble components all work together to create a truly independent individual microgrid for your home so you can still generate energy even during grid outages.

In this article, we'll take an in-depth look at the latest Enphase Ensemble technology, including how it works, the various components, the benefits of the system, and how much it costs.

With Ensemble(TM) technology, when the grid is down, you have power. And when the grid is up, you can save money. Photo courteous of Enphase Energy.

The Enphase Ensemble is a family of technology that is designed for either whole-home or partial-home solar energy storage and backup in the case of a grid failure.

The system includes the Encharge 10 or Encharge 3 storage systems (or a combination of both), the Empower smart switch, the Enlighten cloud monitoring platform, and the Envoy combiner. The system is designed to be used with any of the Enphase IQ series of microinverters.

All of these components work together to provide you with instant seamless backup electricity from your grid-tied solar energy system when the grid experiences a grid failure. As we mentioned above, this system is unlike other traditional grid-tied solar energy battery backup systems in that it will still produce energy to power your home even when the grid is down. If there is excess energy being produced beyond what your system is using, the excess will go to the storage system for later use.

The Enphase Ensemble is an amazing option for those who are planning to install a completely new solar energy system as well as for those who already own a solar energy system that uses any of Enphase's IQ series of microinverters since they can easily handle the addition of the entire Ensemble system.

Unlike the LG Chem, you are not required to get any kind of certification to purchase or install the Ensemble system. The system requires little to no maintenance, is simple to install, and easy to monitor, and it works out to be less expensive over the lifetime of your solar energy system than many other hybrid and off-grid battery backup systems.

The Enphase Ensemble is very reliable since it is the first truly grid-independent solar energy battery backup

Enphase ensemble system

system. It is the result of over 10 years of research and development and more than 300 patents. The monitoring system allows you to see exactly how much energy you are harvesting from your solar energy system and you can even control the system using existing home technologies like Alexa.

By its very nature, the Ensemble is more reliable than other backup battery systems on the market today. Other available systems are hybrids, which means they are partially grid-reliant. With those, when the grid goes down, your ability to produce more power via your solar panels is cut off to prevent your home from becoming an "island" of energy in the grid, which could potentially injure a technician who attempts to fix the grid outage.

So in that case, you are limited to only the energy that was stored in your battery at the time the outage began, which is a best-case scenario that may offer you 10-12 hours worth of energy. Grid outages may last several days, so your expensive investment in a grid-reliant battery backup system may leave you in the same powerless boat as your neighbors within less than a day, which can be very frustrating and even potentially dangerous.
