EDPR completes agreement with Sunseap to establish its Asia-Pacific headquarters in Singapore

EDPR reinforces its presence in the Asia-Pacific region through the investment in the Singaporean group Sunseap

As Southeast Asia moves towards building the region's own interconnected power grid, it can look to Europe's successful energy network for key lessons, said observers.

STOCKHOLM: In the Swedish capital, energy provider Stockholm Exergi uses resource-efficient solutions, including generating power from biofuels and incinerating waste, to supply electricity and heating to residents.

Stockholm is aiming for a fossil fuel-free future with net-zero emissions by 2040.

"Society will not be able to get rid of all fossil emissions, even when we are at net-zero. The only way to do that is ... by creating negative emissions," said the energy company's head of research and development Fabian Levihn.

The firm aims to store carbon dioxide permanently in the ground after removing it from the atmosphere, and use this to counterbalance other emissions.

It has spent over 150,000 engineering hours on a carbon capture project which could work hand-in-hand with energy generation in the future.

"We are looking at an (integrated power plant) design where ... the energy used in the carbon capture process can be recovered back into district heating," said Dr Levihn.
