EV Charging Stations for Hotels and Other Hospitality Properties Increase Guest ...

The Cable Retractor is another helpful solution, with its spring-loaded tether to ...

EvoCharge is a premier electric vehicle charging station company, providing ...

Transform your parking lot into a dynamic multi-use space by integrating electric vehicle charging stations. Attract a broader customer base, including eco-conscious EV drivers, by offering convenient charging solutions. Implement customizable pricing strategies for charging services to generate additional revenue streams while sharing costs and profits with your clients. Maintain stable operating expenses by adopting a monthly subscription model for charging services, ensuring a consistent revenue flow and enhanced customer satisfaction. This approach not only diversifies your services but also positions your facility as a modern, forward-thinking establishment.

Upgrade your parking facility with smart EV charging stations to offer a seamless and efficient charging experience. Our state-of-the-art charging stations come equipped with intelligent software that allows for real-time monitoring and management of charging sessions. This technology enables you to optimize energy usage and manage peak demand efficiently, reducing energy costs and ensuring availability for all users. Enhance the convenience for your clients with features like app-based controls and notifications, which allow drivers to manage their charging process remotely and receive updates on charging status, thus improving overall user satisfaction and operational efficiency.

Talk with an expert who can evaluate your EV charging needs and match you with the right solution.

137 Keyuan RoadChongqing, China

Charging EVs in parking lots with solar power is a marriage made in heaven. But the general rule for any solar or charging installation is that it be grid tied, so it can charge vehicles from the grid when the sun is not shining, and feed excess power back to the grid when the cars are not charging.

In spite of that, a company named Beam Global is selling solar charging stations for parking lots with batteries and claims they are more cost effective in many cases to grid connection.

Off-grid systems must deal with the cost of their batteries, their solar panels, and the waste that comes from mismatch between car demand and solar production, both of which vary based on time of year, type of driver, and weather.

Ev chargers for parking lots

Beam claims their system is cheaper because of the high costs of a grid-based or grid-tied-solar charging installation. Such projects usually involve consultants, plans, permits and then trenching and digging up the parking lot to install wiring. The wiring run and trench may be quite involved depending on where the chargers are sited. There can often be a need to expand electrical service to the building (though if systems were better designed that would not be true.)

However, for locations where grid-tied charging is not so expensive to install, because wiring is nearby or permits and construction are easy, they are less likely to win on cost, but they still would win on hassle and install time.
