Our combined knowledge, your competitive advantage

The South African city, which has a higher population than the country's capital Johannesburg, faces more than a few bumps in the road if it is to reach its target by next year.

Its energy executive director Kadri Nassiep said: "Renewable energy penetration is on the increase but is not as fast as we would like it to be.

"The independent power producer [IPP] procurement process has been fraught with regulatory and policy issues.

"Cape Town has abundant wind and solar photovoltaic resources, but we need to overcome regulatory and political barriers to raise our numbers significantly."

Based in northwestern Cape Town, Phelan Energy Group is a renewable energy supplier, founded in 2005, with additional offices in Dublin, New Delhi, Dhaka, Buenos Aires, Sydney and the Middle East.

Its main area of business is solar photovoltaic solutions and it claims to be committed to achieving the "lowest-cost solar power products";.

The company is actively developing solar projects in 12 International markets, and claims to have installed 175 megawatts (MW) of clean power across South Africa.

Phelan Energy is also in the midst of installing 250MW in the Middle East and Asia, and is reportedly on the path to establishing a pipeline of more than 2,000MW across the globe.
