

Kigali clean electricity

How a sustainable and affordable neighbourhood becomes a game changer for Rwanda's capital Kigali

The Green City Kigali is a pioneering concept responding to emerging global issues. Africa's cities are rapidly growing. The United Nations expect the continent's population to double by 2050, most of which will be concentrated in urban areas. Addressing this tendency is both a challenge and an opportunity as many move to the city in the hope of finding employment and better living conditions. It is key that these trends do not lead to further growing inequalities, poverty and environmental degradation.

The Government of Rwanda is committed to global goals and dedicated to set standards for sustainable urban development. Taking a holistic approach to integrate green building and design, efficient and renewable energy, recycling and inclusive living, the Green City Kigali will become a blueprint for other cities, for the region, for the continent.

The planned neighbourhood will be the first Green City in Africa. A place of sustainable, affordable, green and inclusive urban living. A place full of life.

Develop a model community in Kinyinya Hill, Kigali to showcase a neighbourhood of affordable homes where residents enjoy the social and economic benefits of urbanisation while minimizing ecological footprints

Initiate a paradigm shift towards green urbanization and make a difference by providing answers to one of Africa's biggest challenges of tomorrow

Set standards for green housing solutions and sustainable urban development in Rwanda and Africa

Design an urban space that promotes social cohesion, equality and inclusion and provides much-needed affordable housing for lower income groups

The Green City Kigali focuses on six main intervention areas:

By 2060, the share of Africa's population residing in urban areas will be 60 percent - up from 36 percent in 2010. This process of urbanisation is set to put more pressure on basic infrastructure, including housing, sanitation and healthcare among others. The situation is being exacerbated by climate change, which has occasioned flooding and dry spells in equal measure.

Alive to the complex matrix that comes with the urbanisation trend in Africa, countries are embracing smart-city solutions as they seek to address growing inequalities, poverty and environmental degradation.

Kigali clean electricity

In a first of its kind development, the East African landlocked nation is in the process of building the first green city on the continent through the Government's Economic Development and Poverty Reduction Strategy (EDPRS).
