

Map of charging points uk

Map of charging points uk

We have detailed information on almost all public chargers in the UK, plus a whole ...

At 1 July 2024, there were 64,632 public electric vehicle charging devices available in the UK. Of these, 12,474 were 50kW and above. The Electric vehicle public charging infrastructure statistics: July 2024 publication provides further information on charging devices in the UK.

This map shows the density of charging devices by local authority. Viewing options are all devices, devices per 100,000 population and rapid or faster devices. Where a device has more than one speed of connector, it is classified as the highest-speed available.

Each map follows the same colour scale, with the bottom 20% of local authorities (the ones with the lowest number of devices) in pale yellow, and the top 20% in dark blue.

Use the radio buttons in the bottom left of the map to change view. Click on a local authority to see more information about the devices in that local authority.

This map shows the number of public electric vehicle charging devices in the UK. Data on charging devices was provided by the charging platform Zapmap, showing rapid devices reported as operational on 1 July 2024. The map was developed by the Department for Transport and is published alongside the Electric vehicle public charging infrastructure statistics: July 2024.

These statistics are released under the "official statistics in development" label - formerly called experimental statistics. Official statistics in development are official statistics that are temporarily undergoing a development and are being tested with users, in line with the standards of trustworthiness, quality, and value in the Code of Practice for Statistics.

For more information, please see the methodology note.

Population figures are the ONS Population Estimates for mid year 2022.

"Total public charging devices" represent publicly available charging devices at all speeds.

Charging devices not open to the public, such as private or domestic chargers, are excluded from the map.

A charging device may have more than one charging connector and be able to charge more than one vehicle at a time, therefore these figures do not reflect overall charging capability.
