

## Oslo electricity consumption

Net consumption of electricity is defined as the sum of all measured electricity consumption for primary industries, secondary industries, tertiary industries and households. Electricity consumption is divided into consumer groups based on the standard for sector classification 2007.

The energy account shows all energy products produced and used by industries in the Norwegian economy, including abroad. Also included are figures for energy intensity and figures from decomposition analyzes of changes in energy consumption. The national accounts definitions are followed.

Fossil fuel energy consumption (% of total) Energy use (kg of oil equivalent) per \$1,000 GDP (constant 2021 PPP) Combustible renewables and waste (% of total energy) Electricity production from oil sources (% of total) Access to clean fuels and technologies for cooking, rural (% of rural population)

In 2022, the net domestic consumption of energy in Norway was 219 TWh. Electricity covers a large proportion of the consumption. Norway has a significant energy-intensive industry that uses a lot of electricity. Electricity is also common for heating buildings and tap water buildings.

In the transport sector energy use is mainly based on fossil fuels. However, the use of electricity is increasing, and significant growth is expected in the coming years due to the electrification of vehicles and ferries. Read

# Oslo electricity consumption

more about factors that influence energy use here.

In the mainland economy electricity is the dominant energy carrier, followed by fossil fuels. This is especially true in the industrial sector (excluding the oil and gas sector), households, and service industries.
