

Panama city microgrid operation

Panama city microgrid operation

* Most microgrids contain multiple technologies, so site totals by technology may be greater than the total number of microgrid sites in the state.

*Note: while this system is waste heat to power it may not meet PURPA's definition of cogeneration (aka CHP).

The U.S. Department of Energy Microgrid Database is a comprehensive source of information on microgrid installations in the United States. Established in 2018, the Microgrid Database is maintained by ICF Inc. and is funded by the U.S. Department of Energy. The database is updated on a semiannual basis.

Providing clean, sustainable energy in an underserved community.

The Project Rural Panama Micro/Smart Power Grid Sustainability Initiative Proposal

The Client SES Renewables is partnering with the U.S. Panama Business Council, NSolar, and PROPANAMA to study the feasibility and implementation of micro/smart grids in rural Panama to provide clean electricity to underserved communities with no access to the national power grid. The study has been proposed to the USTDA for funding.

The Challenge Approximately 93,000 families, representing 7% of Panama's population, do not have access to electricity. A majority of these Panamanians are indigenous people living in extreme poverty, a condition made even worse by the lack of electricity and the inability to access the internet. By deploying micro/smart grid systems, Panama's indigenous communities can gain access to permanent, clean, and renewable energy where power delivery is challenging, costly, and unreliable.

The Solution SES Renewables and our partners have proposed to design and build micro/smart grids with US-sourced components to guarantee permanent, clean, and renewable energy to several of Panama's indigenous communities currently without access to electricity. Once the project is granted funding by the U.S. Trade and Development Agency, it will lead to a more stable, sustainable, climate-friendly, and equitable electrical distribution system for the people of Panama.

The Impact Should the project be funded, the information gathered on the feasibility of microgrids for this region will be used for further roll-out to more rural communities, resulting in the following:

An asset integrity management tool that helps to significantly reduce unexpected failures.

Research studies determined the safety and performance characteristics of flow batteries.

Panama city microgrid operation

A Case Study highlighting a groundbreaking approach to sub-seabed sensor protection that significantly reduces costs and enhances the effectiveness of structural health monitoring.
