

Solar panels for shed roof

Solar panels for shed roof

As subject matter experts, we provide only objective information. We design every article to provide you with deeply-researched, factual, useful information so that you can make informed home electrification and financial decisions. We have:

Sourced the majority of our data from hundreds of thousands of quotes through our own marketplace.

Incorporated third-party data and information from primary sources, government agencies, educational institutions, peer-reviewed research, or well-researched nonprofit organizations.

Built our own database and rating system for solar equipment, including solar panels, inverters, and batteries.

We won't charge you anything to get quotes through our marketplace. Instead, installers and other service providers pay us a small fee to participate after we vet them for reliability and suitability. To learn more, read about how we make money, our Dispute Resolution Service, and our Editorial Guidelines.

Many homeowners use their sheds for storage, greenhouses, or as a workspace, but have you ever considered your shed a potential spot for a solar panel installation?

One question you need to ask yourself is whether the roof of your shed is suitable for solar panels. Adding solar panels to your roof has a similar weight addition to installing another layer of shingles on a standard asphalt roof. With traditional rooftop systems, installers will typically conduct an engineering review to ensure that your roof is structurally sound enough to withstand the additional weight of solar equipment. Depending on how your shed was built and what it was built with, its roof may not be strong enough to hold up solar panels.

In addition to structural integrity, space is another aspect to remember when considering solar for your shed. Most sheds are small and don't have a lot of available roof space. Standard residential solar panels are roughly 15 square feet; if you have a small shed, you can only fit a few panels.

Of course, the amount of sunshine hitting your shed is also crucial. What direction does your shed roof face?? A sunny, southern-facing roof is optimal for solar electricity production, but east or west-facing roofs can also work. No matter your shed's roof's direction, you want to ensure it's clear of shade. If your shed is at the edge of your property and obscured by tree branches or shaded by tall buildings, you may want to install your solar panels in another location.

Most homeowners aim to self-generate as much of their home's energy needs as they can once they go solar. The goal is lower electric bills and more savings over time. This can be difficult if you're only installing

Solar panels for shed roof

panels on a shed.

If your shed is large enough, you could look into covering it in enough solar panels to eliminate the electricity bill for your property. This will require running wiring from your shed to your main house if your electric meter is in your home.

Another option is only to install solar to provide electricity to the shed itself. This solution could be beneficial if your shed functions as a workshop that uses lighting or other appliances. Installing panels to cover the electricity usage of your shed will have a lower upfront cost than a typical residential installation because it will require fewer solar panels.
