Solar power stream for renters

Solar Options for Renters

Options that allow renters to take advantage of solar power include:

The PowerStream microinverter looks a bit like an internet router.

I tested the PowerStream micro inverter using the EcoFlow Delta Max and Delta 2 Max.

Here's how the PowerStream kit works: lay the solar panels on your roof, in your garden or attach them to the railings of your apartment balcony and plug them into the microinverter. That then plugs into both the power station and your home's electrical outlet.

Interested in understanding the impact solar can have on your home? Enter some basic information below, and we'll instantly provide a free estimate of your energy savings.

Once set up through the EcoFlow app (a necessary step, but it's available on both iOS and Android), you'll be able to control the flow of energy from the solar panels, directing it toward your home, into the battery or splitting the power between both, charging the battery more slowly while continuing to provide some solar energy to your home.

A portable power station with a solar system designed for a balcony.

The idea is that smaller apartments are able to generate solar energy throughout the day, using some of that power to supplement the power being taken from the grid, while storing excess power in the battery to continue using solar energy overnight -- or to be kept as a backup in case of power outages. While solar solutions for balconies are available from various companies, EcoFlow says it is the first to offer a version that combines home grid usage and battery storage of energy.

I'm not allowed to install solar panels on my roof, so instead I have to unfold portable panels when the sun comes out.

I've been testing the kit for about a week from my home in Edinburgh, Scotland, and I'm impressed so far. Setting the kit up is genuinely a plug-and-play affair and using the app to monitor the input from the solar panels and divert it into the battery, into my home grid or combining the two is straightforward.

My house is historically listed, so local bylaws mean I'm not allowed to install physical solar panels on

Solar power stream for renters

my roof. Instead, I've been using EcoFlow's 400-watt portable panel, simply laying it on my roof (via my upstairs window) and feeding the cable back inside and into a power bank. Previously, I've then just carried that powerbank to wherever I want to use the power (usually my office), but the new microinverter means I'm able to leave the battery next to the window and feed that energy directly into my home grid.
