Solar power without battery storage

Solar power without battery storage

How to Store Solar Energy without Batteries

If you're considering using solar energy as a cleaner power source, and wish to store it, there are various options available. While traditional batteries have drawbacks like environmental issues and costs, it's important to explore alternative storage methods. In this blog, we investigate a range of methods to store solar energy without batteries, ensuring a steady power source.

Is Storing Electricity without Batteries possible?

Yes, it is possible to store electricity without the use of batteries. Many innovative energy storage technologies have been developed that use locally available, safe, and cost-effective methods. Now, let's find out the ways to store solar energy without using batteries.

Solar energy, which is becoming increasingly popular due to its sustainability, is often stored using batteries. Nonetheless, technical improvements have resulted in the introduction of various new, battery-free storage alternatives. These methods are listed below:

A recently discovered concept involves using electricity generated by solar panels to pump water to elevated heights such as a rooftop. This process effectively stores potential energy, which is then transformed into kinetic energy as the water travels downwards. When the running water is utilized to turn turbines, it generates energy. Therefore, it's a solar-hydropower combination.

Another option is to route the energy from your photovoltaic system to a water electrolyzer, which produces hydrogen gas from water. This hydrogen gas is stored and can be utilized, much like a battery, to generate electricity at later times, a method primarily used in the industry.

Super-capacitors, which harvest and store solar energy in the form of electricity and then discharge it when needed, are also available. However, these capacitors commonly use carbon as the electrode material and the technology is currently quite expensive.

Concentrated solar power facilities operate using this method, where solar energy heats a fluid that travels through tubes. This fluid passes its heat onto a receiver where the heat is concentrated. The receiver then stores the thermal energy in tanks, making it ready for use when energy is required.

The German utility firm E.ON introduced the E.ON Solar Cloud. It's a platform that virtually stores

## Solar power without battery storage

electricity, functioning a bit like how online cloud storage works. There's also an app that allows users to see how much electricity they've stored. By doing so, the platform aims to balance the energy users consume with the energy their solar system produces. This unique strategy eliminates considerable upfront costs and maintenance difficulties; it is an illustration of how energy storage options are advancing.

Flow battery uses two liquid-filled chambers to store and release energy using a chemical process. Scientists have discovered a sugar-based flow battery using ??-cyclodextrin, which comes from starch. This sugar battery can store energy for more than a year. For more details, check out this link.
