Tesla solar roof bulgaria

Tesla is launching a new solar roof tile with greater efficiency and higher power capacity. It comes as Tesla is trying to make its solar products mainstream.

The product has been widely recognized for its beautiful design. It undeniably has significant advantages over regular solar panels, with the ability to penetrate markets like new houses and homes that need a roof replacement relatively soon.

However, it has been hard to bring it to market.

Tesla has had issues testing for longevity, with prices fluctuating widely as the company realized the difficulties of create a streamlined product for such different things as roofs.

As we previously reported, Tesla significantly increased the price of the solar roof tile earlier this year, after introducing a new "roof complexity factor."

But the company claimed that the demand for the solar roof was still strong after this price increase, and that installations are accelerating.

Now we learn that Tesla is making a significant upgrade to its solar roof with a new, more powerful, solar tile.

Electrek has obtained a datasheet for the new solar tile that Tesla has started to include in solar roofs designed for customers.

Tesla previously used its SR60T1 tile, with a 58.5-watt capacity, in solar roof designs.

Now the company is now producing quotes and starting installations with a new SR72T1 solar tile.

With more efficient solar cells, Tesla managed to maintain the same tile size with a 22% increase in max power output.

In a solar roof installations, Tesla installs tiles with solar power and some without. The company tries to optimize each roof by installing the tiles with solar cells where they would be more efficient.
