

Types of energy storage poland

The energy storage projects we encounter on the Polish market are of great diversity, ranging from battery storage facilities with relatively small total installed capacities, through contracts focusing on the joint development of specific technologies (hydrogen, ammonia) for commercial use, to large energy storage facilities within pumped ...

The most popular methods of electric energy storage are described, with an indication of the features of each technology, along with the presentation of the advantages and disadvantages of a given storage reservoir. Next, hybrid energy storage systems are presented along with their suggested applications and advantages resulting from the ...

The new rules create an opportunity for Poland to create a broad energy storage industry, PSME's president said, from the development of technologies and products to the creation of jobs. In the main power market auction in 2022, battery energy storage was contracted for the first time - 165 MW to be exact.

PGE's unique on a European scale energy storage project in Żarnowiec with a capacity of no less than 200 MW has obtained the first license promise in Poland for electricity storage in a large-scale electrochemical energy storage facility.

For more than a decade, other types of RES have been developed in Poland, including bioenergy, solar power and, most of all, wind power. The renewable energy sector in Poland has been increasing and developing dynamically. In 2016, renewable energy accounted for 13.3% of Poland's total consumption and was mostly generated from biomass.

In the era of green transition and de-carbonisation, the instability of renewable energy sources compared to fossil sources is a serious obstacle. / Foto via unsplash [Thomas Kelley]

This article is part of our special report Atom, blackout, dekarbonizacja, OZE: Wszystko co trzeba wiedzie? o transformacji energetycznej.

Along with the rising prices of energy from fossil sources and the global trend towards climate transformation, renewable energy sources are gaining on popularity in Poland and other European countries. However, the disadvantage of renewable energy, especially compared to carbon, is its limited stability and controllability. Renewables are very much dependent on weather conditions, such as wind and sun.

That is why energy storage comes as such an important solution. They enable to increase the stability of the RES-based system, which translates into energy security.

"Energy storage, moderately important in the current power system based on stable coal-fired power plants, is becoming a key element in the pending energy transition. The new energy mix will be increasingly based on clean, renewable, future-proof sources, which are, however, rather unstable ", points out Jan Ruszkowski, communication specialist at the Polish Green Network.
