

Utility-scale solar singapore

Utility-scale solar singapore

As the leading solar energy player in Singapore, we are well-positioned to ...

SolarLand 2 (SL2) is a state-of-the-art ground-mount photovoltaic (PV) powerplant owned by Terrenus Energy SL2 Pte. Ltd. The plant harnesses energy from the sun -- Singapore's most available renewable resource -- and converts it into electricity. The generation process does not release carbon into the atmosphere, making it a clean alternative to using fossil fuels that can help mitigate climate change. Using cutting-edge technology, solar expertise and innovation, SL2 has a total solar capacity of 19.2 MWp - a 60% per cent increase from the initial 12 MWp requirement of the tender issued by JTC.

All of SL2's electricity output goes directly to the national grid, contributing towards Singapore's goal of 2 GWp total solar capacity by 2030. The project introduces new renewable energy innovations and a land-savvy approach, creating new opportunities for the small city-state to embrace renewables into its Energy Story for a sustainable future.

SL2 is installed on 116,000 square metres of interim industrial land at Changi Business Park. In the event the land is reclaimed for other uses in future, SL2's mobile design allows it to easily redeployed, requiring significantly less time and cost to dismantle, transport, and install elsewhere.

Learn how SL2 maximises its use of land for RE generation.

Behind Singapore's largest renewable energy ventures.

JTC Corporation's SolarLand programme aims to overcome space constraints and high capital costs while at the same time, reduce the carbon footprint and optimise the use of industrial land to contribute clean energy to Singapore.

There are new innovative projects underway. JTC and Terrenus Energy renewed their partnership for the SolarLand 1 Extension project, which pilots solar, tidal, wave and wind technologies in Singapore. When completed, it will be the world's first four-in-one renewable energy facility and is expected to deliver one of the highest energy yields per square metre in the world.

All you need to know about utility-scale solar and how it impacts you.

Utility or large-scale solar farms - also known as solar parks or solar power stations - are solar installations where a large collection of photovoltaic (PV) panels, is used to absorb the sun's power to generate power. Like traditional coal or oil powerplants, solar farms produce huge amounts of electricity that is sent to the local power grid. The grid then distributes the electricity to homes and businesses either directly, or through

Utility-scale solar singapore

electricity retailers.

Unlike traditional coal or oil powerplants, the entire energy production process in solar farms does not emit any carbon into the atmosphere, giving it the term "clean" energy. Most sources of clean energy are also renewable, which means that they don't run out or are naturally replenished over short periods of time, whereas fossil fuels are non-renewable and are expected to run out soon.

Because of these attributes, renewables have long been hailed as the mandatory next step for the global energy sector in tackling climate change. The transformation from a fossil fuel-based energy industry to a renewable one is called the energy transition and requires a massive revamp of today's energy framework. This means more solar panels decorating the world's surface.
