

# Who makes saf fuel

Who makes saf fuel

Sustainable Aviation Fuel (SAF) is an alternative to conventional fossil aviation fuel produced with biological and non-biological resources. The variety of feedstocks used to produce SAF, to replace oil, coal or gas typically used in traditional jet fuel, can be derived from both plant and animal materials, ranging from cooking oil and plant ...

Here's everything you need to know about the future of jet fuel and the climate. What are SAFs? Planes today mostly burn jet fuel, also called kerosene--a fossil fuel with a mix of carbon ...

Flights are huge sources of emissions, but airlines could cut their carbon footprints by transitioning to sustainable aviation fuel (SAF). SAF is a type of biofuel - meaning it is made from plant or animal materials rather than fossil fuels - and it has the potential to cut aviation's greenhouse gas emissions by up to 80% compared with ...

Neste is the world's leading sustainable aviation fuel (SAF) producer, offering SAF made from sustainably sourced renewable waste and residues such as used cooking oil and animal fat waste. SAF is a proven solution reducing GHG emissions by up to 80%\* over the fuel's life cycle, compared to using fossil jet fuel.

How trash, cooking oil, and green electricity could power your future flights.

MIT Technology Review Explains: Let our writers untangle the complex, messy world of technology to help you understand what's coming next. You can read more here.

The future of flying might depend on french fries, trash, and sunlight.

Aviation accounts for about 2% of global carbon dioxide emissions, and once you add in other polluting gases, the industry is responsible for about 3% of all human-caused global warming.

One way the aviation industry hopes to cut down on its climate impacts is by using new fuels. These alternatives, often called sustainable aviation fuels (SAFs), are made from a wide range of sources and can largely be used by existing planes. They could be the key to helping this sector meet its climate target: net-zero carbon dioxide emissions by 2050.

New policies in both the European Union and the US are boosting these new fuels, and airlines are pushing ad campaigns that feature their efforts to switch fuel sources.

But while alternative fuels could be a climate solution for aviation, their actual impact will depend on a lot of factors. Here's everything you need to know about the future of jet fuel and the climate.

## Who makes saf fuel

Planes today mostly burn jet fuel, also called kerosene--a fossil fuel with a mix of carbon-containing molecules. The mix of those molecules can vary, but the primary ingredient is simple chains of carbon and hydrogen that are packed with energy. Alternative fuels have the same basic chemical makeup as fossil fuels; the difference is that SAFs are derived from renewable sources.
