

# Whole home solar generator

## Whole home solar generator

Gone are the days when you needed to run gas or diesel generators all day, creating excessive noise and pollution. Solar generators are the new standard for energy production, as they operate cleanly, quietly, and efficiently.

Solar generators can power a whole house -- but how do you know which size of solar generator to purchase?

Consider your household's electricity consumption, the frequency and duration of power outages, and other factors to determine the right solar generator size for your home.

Yes, a solar generator can power a whole house, but it depends on the size of the generator, the size of the house, and the household's energy consumption. Generally speaking, a 2000-watt solar generator should be enough to cater to the needs of a typical house.

A solar generator typically includes photovoltaic solar panels, an inverter, a solar battery, and other balance of system components. Your solar generator's power output and storage capacity largely determines what appliances you can run and for how long.

The amount of solar energy your solar panel array can capture depends on the rated power, efficiency, and number of PV panels you deploy. It also depends on environmental factors -- like peak sunlight hours at your location -- but solar panels can capture solar energy even on overcast days.

Depending on your household's electricity consumption, It may be necessary to supplement your solar generator's output and storage capacity with grid-tied power or a backup generator during periods of low sunlight or high energy usage.

Many companies offer modular solar generator systems that can run a tiny home or RV off-grid. For instance, EcoFlow Power Kits include a power hub, distribution panels, inverters, stackable solar batteries, and other components.

Here are the crucial factors to consider when determining how big a solar generator must be to power your household.

The size of a solar generator required to power a whole home depends on your family's energy consumption.

The typical American household uses around 30 kilowatt-hours (kWh) of electricity per day, but using a ballpark figure when investing in a solar generator is never a good idea.

# Whole home solar generator

One way to estimate the size of the solar generator you need is to average the electricity consumption shown on your monthly electricity bills -- preferably over the course of a year.
