Built upon the technology of its predecessors, GE Vernova's 3 MW ...

GE Wind GE Vernova ??2018,GE Wind?Vic AbateGE Vernova?

GE Wind is a division of GE Vernova. The company manufactures and sells wind turbines to the international market. In 2018, GE Wind was the fourth largest wind turbine manufacturer in the world.[1] Vic Abate is the CEO of GE Vernova's Wind businesses.[2]

The entity was created as developer (not manufacturer) Zond in 1980 by James G.P. Dehlsen, who also formed Clipper Windpower in 2001. Enron acquired Zond and the German manufacturer Tacke Windtechnik in 1997.

In 2002, while gas turbine sales were declining,[3] GE acquired the Enron Wind, the only surviving US manufacturer of large wind turbines at the time, during the bankruptcy proceedings of its parent, Enron. GE increased engineering and support for the Wind Division and doubled its annual sales to \$1.2B in 2003.

GE acquired ScanWind in 2009,[6] and in 2011 Wind Tower Systems LLC, a manufacturer of space frame wind turbine towers.[7]

After the acquisition of Alstom's energy generating assets (2015) GE's wind portfolio was expanded to include the 6-megawatt "Haliade" offshore turbine (at that time one of the world's most powerful turbines) from Alstom Wind. This became GE Offshore Wind. The same year, GE added Blade Dynamics Ltd., a designer and manufacturer of modular wind turbine blades with principal facilities on the Isle of Wight and in Southampton.

GE acquired LM Wind Power from Doughty Hanson & Co for an enterprise value of EUR1.5 billion in April 2017.[8]

Several optional features support its presence in electrical grids, including voltage regulation, low voltage ride through, and the delivery of reactive power during grid disturbances or periods of low wind.

To further wind power research, a unit was commissioned at the National Wind Technology Center in late 2009. Its 10,000 installations in the US at the time constituted 50% of the national commercial wind energy fleet, influencing the NREL's decision to install a model at the Center.

The next evolution, the 2.5XL, used a permanent magnet generator, and its entire output was converted to AC at mains frequency. The platform was then moved back to the use of a doubly-fed generator and rotor

Wind turbine ge

converter, similar to the 1.5 series.

As of 2022, GE had over 40,000 turbines installed across the globe.[25]
